

Cold synchrony across CONUS

Median local pair synchrony for joint lower-tail TMIN days: both pixels are at or below their own TMIN median

Warm synchrony across CONUS

Median local pair synchrony for joint upper-tail TMAX days: both pixels are strictly above their own TMAX median

Cold-minus-warm synchrony across CONUS

Primary pixel value = median over neighboring pairs of $\Delta = S_{\text{cold}} - S_{\text{warm}}$; red is negative/warm stronger, blue is positive/cold stronger
